2

3 DISTRIBUTED SEARCH SYSTEM AND METHOD

4

5 ABSTRACT

6 A method and system for providing distributing a query to
7 devices on a communications network, such as servers on the
8 internet, using an application that can survey a subscriber's
9 server that can include text documents and databases, and use the
10 formatting information and data from the survey to create at
11 least one dictionary customized to the subscriber's data sources.
12 A user seeking information can initiate a search or query from
13 an initiating device using keywords, natural language terms,
14 connectors, expressions, etc., and the query can be transmitted
15 to various subscriber customized dictionaries. The customized
16 dictionaries can customize the query based on respective
17 subscriber databases and text documents, text search engines,
18 etc., to produce an customized query result. The query results
19 can be filtered and integrated for presentation to the initiating
20 device. Search results can be customized using user preference
21 or profile information.
